WHY THIS OPPORTUNITY MERITS A CLOSER LOOK

Six concessions form a gold-silver opportunity anchored by mapped low-sulfidation epithermal veins, 31 samples and a defined exploration pathway. The commercial footprint extends beyond the detailed 2020 study area.

Mapped epithermal vein system

Two principal veins and secondary structures occur in metallogenic belt XVIII. Quartz, iron oxides and argillic alteration accompany the east-west principal structures.

Selected analytical results

Separate samples on the first vein returned 24.38 g/t Au and 24.00 oz/t Ag. A second-vein sample returned 4.02 g/t Au and 7.68 oz/t Ag; these are local sample results.

EVIDENCE	DOCUMENTED DETAIL
STUDY FOOTPRINT	2020 evaluation: five concessions / 2,042 ha
STRUCTURE WIDTHS	Principal veins: 0.30-0.80 m and 0.80-1.00 m
SAMPLE RECORD	31 samples: principal and secondary veins

INVESTMENT PROFILE

Commercial structure

US$30 million asking price; sale, investment or strategic partnership. Mining and processing development form part of the broader concept.

Exploration pathway

Systematic sampling, lateral and depth-continuity testing and 3D modeling can advance the mapped vein targets.

Technical context

The 2020 study covers part of the approximately 2,700 ha package. Individual assays are not average deposit grades, mineral resources or reserves.

Our value proposition is centered on Operational Certainty: all assets under our management have been verified. We guarantee projects with clear and clean title, fully updated registrations in full legal compliance, and established social under strict standards.
